

Snowplow at de Bijenkorf de Bijenkorf

Agenda

- Introduction
- Why do event tracking?
- Architecture
- Use cases
- Lessons learned
- Questions

Introduction

- Niels Reijmer
 - Project role:
 - Data analyst

Andrei Scorus

- Project role:
 - Main ETL developer

De Bijenkorf

- 145 year old high-end department stores
- New course: closing 5 out of 12 stores
- Focus on premium personal service!

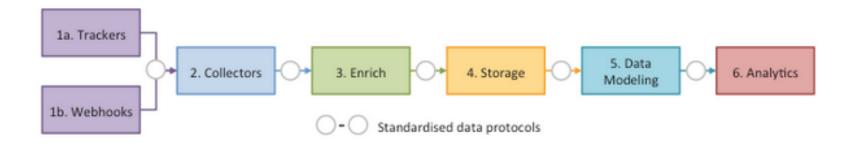

Why do event tracking?

- Stay ahead of the market
- Adds flexibility to the analysis possibilities
- Makes advanced analysis possible
- Focus on premium service also online: recommendations

What is Snowplow?

The Snowplow enrichment process processes raw events from a collector and

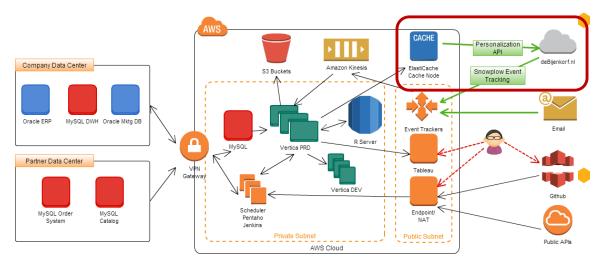

Cleans up the data into a format that is easier to parse / analyse

Enriches the data (e.g. infers the location of the visitor from his / her IP address)

Stores the cleaned, enriched data

Architectural overview

AWS

- S3
- Kinesis
- Elasticache
- Elastic Beanstalk
- EC2
- DynamoDB

Open Source

- Snowplow Event Tracker
- Rundeck Scheduler
- Jenkins Continuous Integration
- Pentaho PDI

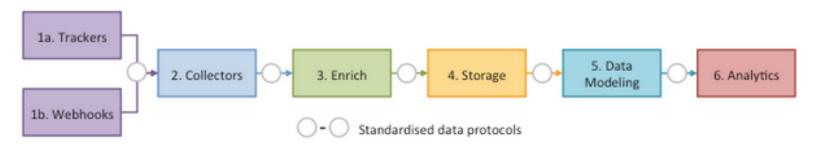

Other

- HP Vertica
- Tableau
- Github
- RStudio Server

Snowplow implementation

- Tracker provided by Snowplow and fired using Google Tag Manager
- 2. Collector in Elastic Beanstalk
- Enricher in Kinesis
- 4. Storage in the Vertica environment
- Data modeling
- 6. Analytics in R, Tableau, etc.

Uses

- Reporting
- A/B test analysis
- Personalisation on the website
- Advanced analysis (next talk)

Data and dashboards

- Why snowplow?
 - Data can be combined in many ways due to the granularity
 - Any question can be answered
- We do not rebuild Google analytics

Example of a dashboard

A/B test data

 \rightarrow CR: 2.4% +20%

A/B test data

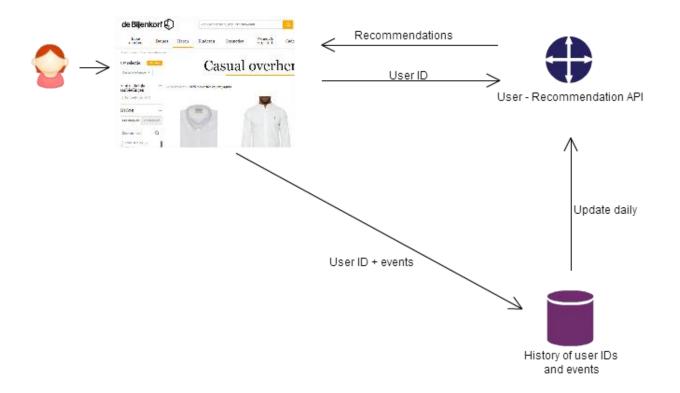

Further analysis in snowplow to determine what happened

Recommendations

Overview

- Something to recommend: 50.000 products
- Ability to make models: R, python, sql
- Historical data on each individual user
- Recognize users over sessions

Data availability

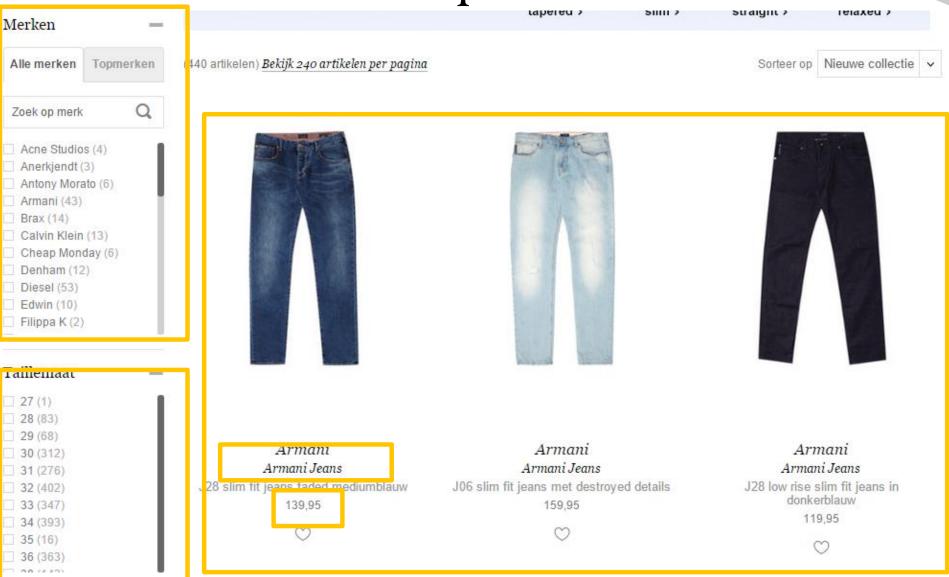

Individual data ©
Limited rows per user
Major cold-start problem

Individual data ©
A lot of rows per user ©
Minor cold-start problem ©

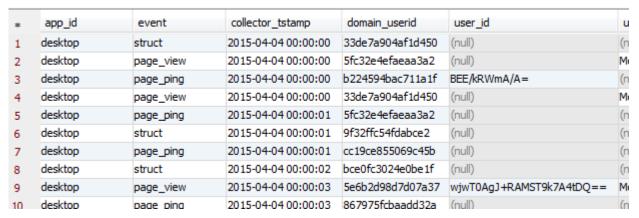

What data for example

Recognize the user in multiple sessions

- For historical data processing:
 - Snowplow has two user identifiers:

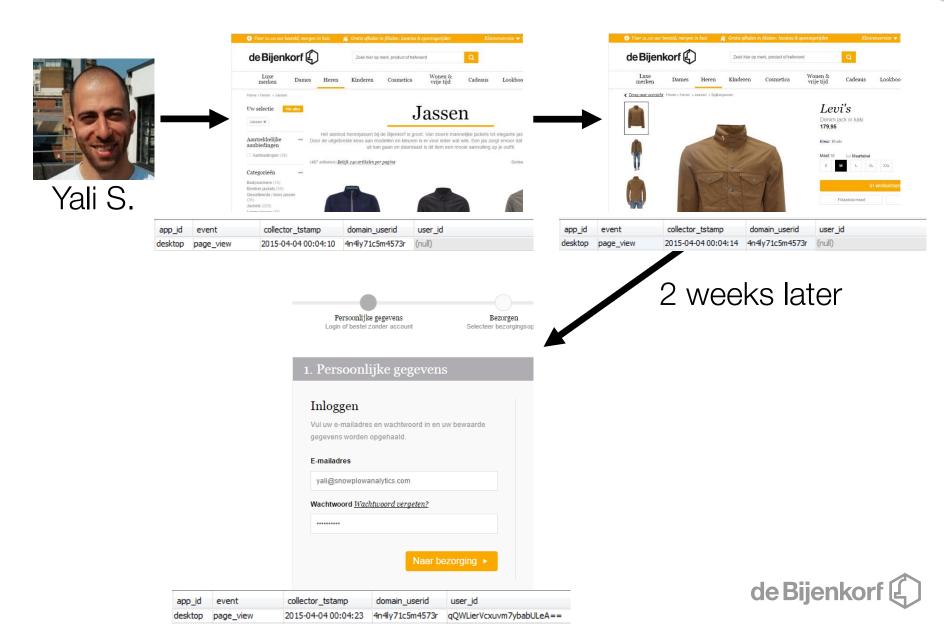

User_id is entered on (soft) login

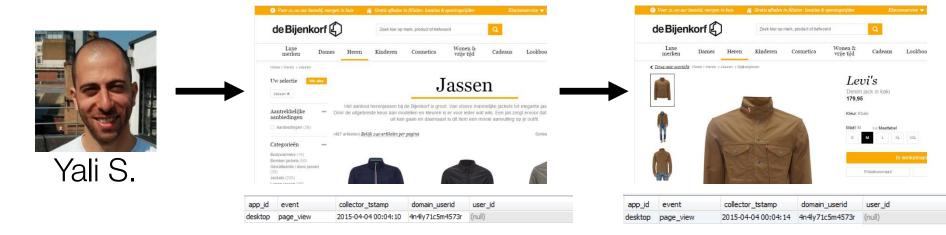

The challenge is to link the domain_userid to the userid

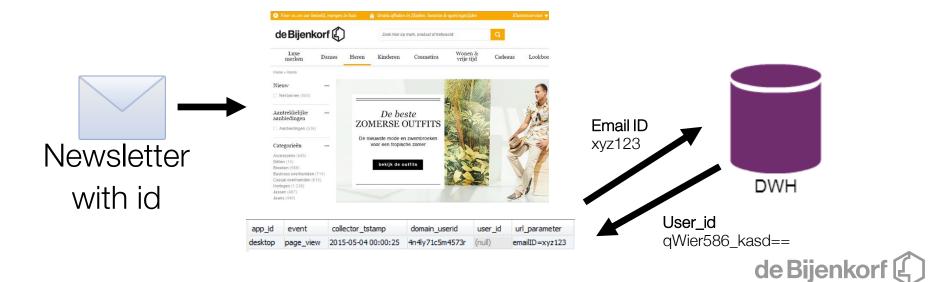

Recognize the user

Identify user from email

2 weeks later

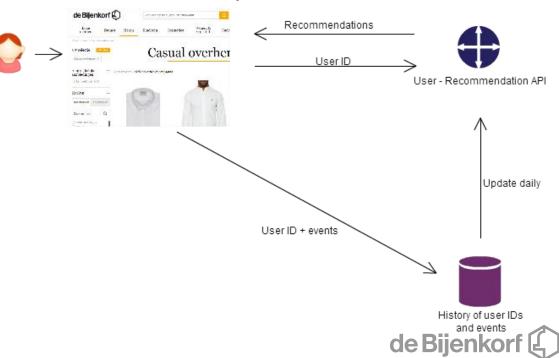

Recognize user during the session

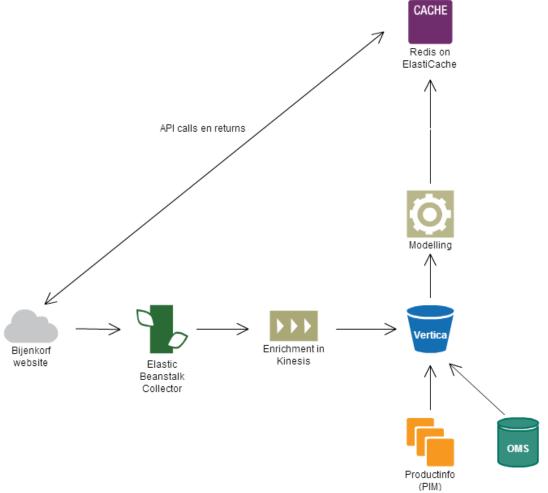

We can link the domain_user to the userid

But we need to have a user ID to use for the API call:

- User is known from their account login
- User is already known from their snowplow id
- User is unknown
 - Nothing.....?

Recommender dataflow in detail

- User is known from their account login
- User is already known from their snowplow id
- User is unknown
 - Nothing.....?

Lessons learned

Implementation

- Fairly easy to start, but highly customizable
- Documentation of your implementation should be in sync with the actual implementation.

Reporting, A/B testing

- More insights possible, adds flexibility
- Need additional tools/resources to make it usable for non-technical people
- Google Analytics and Snowplow can complement each other

Recommender

Just start and keep it simple ©

Questions?
